Summary This closed-loop speed controller is designed with the latest type IGBT and MOS power devices. It takes advantage of DC brushless motor's Hall signal to double frequency for closed-loop speed control. PID control links with the speed controller. The control system is stable and reliable, especially at low speed, it always can reach the maximum torque, The speed control range is from 150 to 20000rpm.

1. Features

- PID speed, current double loop regulator.
- 20KHz chopper frequency.
- Electrical stop to ensure the quick action.
- Over load ratio larger than double, the torque can always reach the maximum at low speed.
- Fault alarm function with Over voltage, Under voltage, Over current, Over temperature, and incorrect Hall signal.

2. Product Characteristic

Drive model	DS-OLBS2-FRS4
Input voltage	24 VDC - Under voltage protection : 12±2 VDC - Over voltage protection : 40±2 VDC
Continuous output current	5 A
Max. output power	100 W
*The default current setting is 5A, different current can be modified by changing the parameters	
Factory value of acceleration time constant	1sec, others can be customized

Warning

- * Do not measuring or touch any components without housing while operating.
- * Should check soleplate or change fuse 1minute later after power off.
- * Operating without housing is prohibited.
- * Make sure to connect the ground terminal, otherwise the brushless motor will working improperly.
- * Sudden damage while drive is working, our company only affords the service and replacement guaranteed. Personal injury and motor damage caused by the accident will invalidate the guarantee.

3. Terminal Connection

3.1 Power Input

No.	Terminal Name	Description
1	V+	8VDC~24VDC input
2	GND	GND input

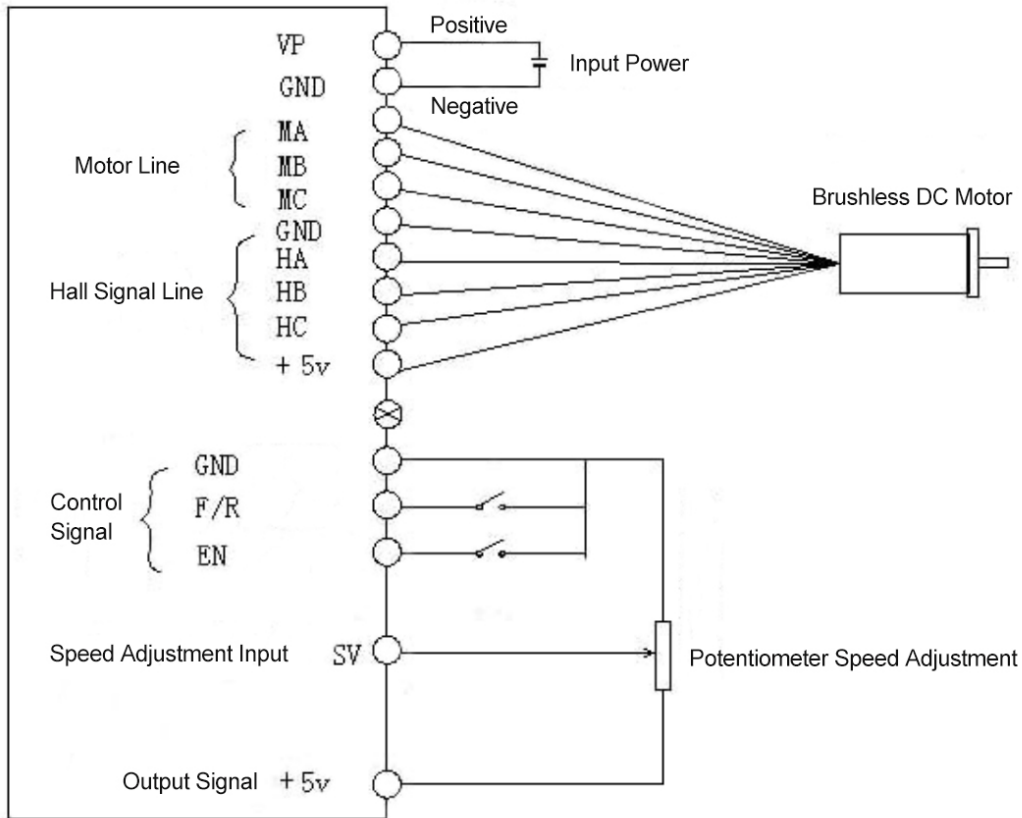

3.2 Motor Input

No.	Terminal Name	Description
1	MA	A phase
2	MB	B phase
3	MC	C phase
4	GND	GND
5	HA	Hall signal A input
6	HB	Hall signal B input
7	HC	Hall signal C input
8	+5V	Hall signal power line

3.3 Control Signal

No.	Terminal Name	Description
1	GND	Signal ground
2	F/R	CW/CCW terminal
3	EN	Stop/Start terminal
5	SV	Analog signal input terminal
8	+5V	+5V power output terminal

4. Connection Diagram of Motor and Driver

5. Dimension : 86×55×20mm

6. Functions and Usage

6.1 Speed Adjustment Method

External input adjustment : Connect the terminals of the external potentiometer to the GND and +5v terminal, connect the regulator terminal to SV, then you can adjust the speed by using an external potentiometer. It also can achieve speed adjust through other control units (Such as PLC, SCM, etc.) input analog voltage to SV. The acceptance of SV is DC 0V~+5V, and the corresponding motor rotation speed is 0 to rated speed.

6.2 Motor Operation / Stop Control (EN)

You can control the brushless motor to run or stop by controlling the terminal “EN” and “GND” connection. The motor will be running when we connect the terminal “EN” to “GND” ; when shut down, the motor will stop naturally, and the stopping time will be decided by the inertia and load added to the motor.

6.3 Motor Rotation Direction Control (F/R)

You can control the motor rotation direction by controlling the terminal “F/R” and “GND” connection. When connect terminal “F/R” to terminal “GND”, the motor will run at CCW (view from motor output side), and when shut down, the motor will run at another direction.

Attention

If you need to change the motor rotation direction, please stop the motor at first, otherwise the driver shall be damaged.

6.4 Driver Failure

Over-voltage or over-current will lead the driver to a protection status, the driver will automatically stop operation, the motor stop and blue light will blink. As long as you enable terminals to reset (EN and GND disconnected) or power off, the driver will stop alarm. Please check the motor wiring once this failure occurred.

6.5 RS485 Communication Port

The driver communication mode adopts the standard Modbus protocol, which conforms to the national standard GB / T 19582.1-2008. RS485 based two-wire serial link is used for communication, and the physical interface adopts conventional 3-pin wiring port (A +, GND, B -), which is very convenient for serial connection.

If the driver control adopts communication mode, it is directly connected to the upper computer through RS485 and controlled through RS485 communication command. Transmission mode RTU, validation mode CRC, CRC start word FFFFH. Data mode: 8-bit asynchronous serial, 1 stop bit, invalid bit check, and fixed communication rate of 9600bps. Specific communication instructions and sample routines can be obtained from DINGS'.

7. Use of Product C

1. Ensure that motor line, hall line and power line connected correctly, Motor and driver will be damaged if lines connected incorrectly.
2. When adjusting speed with an external potentiometer, connect the moving point (intermediate interface) of the external potentiometer to the SV port of the driver and the other two to GND and + 5V ports.
3. Power on and run. At this time, the motor is in the closed-loop maximum speed state. Adjust the attenuation potentiometer to the required speed.

8. RS-485 Communication C

The communication mode adopts standard Modbus protocol and RS485 based two-wire serial link communication. The physical interface adopts conventional 3-pin wiring ports (A +, GND, B -). It is directly connected to the host computer through RS485 and controlled by RS485 communication command. Transmission mode RTU, validation mode CRC, CRC start word FFFFH. The data mode is 8-bit asynchronous serial, 1 stop bit, invalid bit check, and the communication rate is fixed at 9600bps. The register is defined as follows:

No.	Address	Name	Setting range	Default	unit
00	\$8000	First byte : control bit state	First byte : Bit0: EN Bit1: FR Bit2: BK Bit3: NW1 Bit4: NW Bit5: KHX Bit6: HR60 Bit7: KH	00H	
		Second byte : Hall angle and motor poles	Second byte : Bit0-7: poles 1-255	02H
